to understand microbiological systems from the molecular to population level with relevance to some applied issues such as medicine or environmental microbiology.

2. Think and create: Students will be able to use multiple thinking strategies to examine issues in microbiology, including the proposal of biological hypotheses and the design and analysis of biological experiments capable of testing hypotheses. Students will be able to apply microbiological knowledge to real world challenges, such as those that may be encountered in medicine or environmental microbiology.
3. Communicate: Students will be able to acquire and analyze biological information from the scientific literature. Students will be able to communicate biological information via verbal, written, and other non-verbal methods such as appropriate graphics.
4. Clarify purpose and perspective: The program will allow students to explore microbiology as a career as well as to apply microbiological and biological perspectives to novel issues or problems within microbiology, medicine, or other disciplines.
5. Practice citizenship: Students will understand and accept their roles as educated biologists and scientists in society. Students will be able to communicate with others, including non-scientists, from the special perspective of an educated microbiologist on issues related to medicine and other topics.

1. Learn and integrate: Through independent learning and collaborative study, students will attain, use, and develop knowledge in biology, chemistry, and related disciplines with specialization in microbiology. Students will be able to integrate biological and chemical information
